Chapter 2: Vectors in Space

Graphing

TEMPLATE

The Vector

ex image here

TEMPLATE

- a quantity with a magnitude and direction
- unit vector $\hat{u} = \dfrac{\vec{v}}{\|\vec{v}\|}$

Vector Operations

- Addition
    - $\vec{a} = \langle 1, 2 \rangle$, $\vec{b} = \langle 3, 4 \rangle$
    - $\vec{a} + \vec{b} = \langle 4, 6 \rangle$

- Scalar Multiplication
    - $\vec{v} = \langle 1, 3 \rangle$, $c = 2$
    - $c\vec{v} = \langle 2, 6 \rangle$

simple inverses for subtraction and scalar division exist.

- Dot Product (also 2d!)

    - geom.:
      img
      $\vec{u} \cdot \vec{v} = \|\vec{u}\| \, \|\vec{v}\| \cos\theta$

    - alg.:
      $\vec{u} = \langle u_1, u_2, u_3 \rangle$, $\vec{v} = \langle v_1, v_2, v_3 \rangle$
      $\vec{u} \cdot \vec{v} = \sum u_i v_i$
    - $\vec{v} \cdot \vec{v} = \|\vec{v}\|^2$

    - two vectors are orthogonal aka $\perp$ iff their dot product is 0

    - $\cos\theta = \dfrac{\vec{u} \cdot \vec{v}}{\|u\| \, \|v\|}$ wtf is equation 2.5 "unique over this range" on abt

    - work $= \vec{F} \cdot \vec{D}$

    - comp (scalar projection)

      $$\mathrm{comp}_{\vec{v}}\, \vec{u} = \|\vec{v}\| \cos\theta$$
      $$= \frac{\vec{u} \cdot \vec{v}}{\|\vec{u}\|}$$

    - proj (vector projection)

      $$\mathrm{proj}_{\vec{u}}\, \vec{v} = \mathrm{comp}_{\vec{u}}\, \vec{v} \cdot \frac{\vec{u}}{\|\vec{v}\|}$$
      $$= \frac{\vec{u} \cdot \vec{v}}{\|\vec{u}\|^2} \vec{u}$$

- Cross Product (3d)

    - geom.:
      img
      $\|\vec{u} \times \vec{v}\| = \|\vec{u}\| \, \|\vec{v}\| \sin\theta$

    - alg.:

    - $\vec{u} \times \vec{v} = \det \begin{vmatrix} \hat{\imath} & \hat{\jmath} & \hat{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix}$

    - result is $\perp$ to both input vectors, direction by right hand rule

    - triple scalar product:
      $\vec{u} \cdot (\vec{v} \times \vec{w})$
      $= (\vec{u} \times \vec{v}) \cdot \vec{w}$
      $= \det \begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix}$

    - if $\vec{u}$ and $\vec{v}$ are the sides of a parallelogram, then its area is $\|\vec{u} \times \vec{v}\|$

    - if a parallelepiped has edges $\vec{u}, \vec{v}, \vec{w}$, its volume is the absolute value of its triple scalar product

    - torque $= \vec{\tau} = \vec{r} \times \vec{F}$

Appendix

matrices, 3x3 determinants

Recall that a elements of a matrix are enumerated a_{ij} where i is column and j is row, both 1-indexed.

$$\begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \end{bmatrix}$$

Recall that the minor of the matrix element here is the 2 by 2 determinant when you take away the row and column of the element in a 3 by 3 matrix. Picking an arbitrary row (or even column), with a_{ij} being an element and M_{ij} being a minor, a 3 by 3 determinant is calculated by

$$\sum_{j=1}^{3} (-1)^{i+j} a_{ij} M_{ij}$$

In the figure `media/3x3determinant.png`, $(-1)^{i+j}$ is in green, a_{ij} in orange, and M_{ij} in blue.

cross/dot products
